Subject: Application for Application Engineer Image Processing (m/f/d)

Dear Ms. Zabun,

As a physics engineer specialized in high-precision metrology and industrial machine vision, I am applying for the Application Engineer position at your Roding site. Your focus on hardware and optical development over pure software programming perfectly aligns with my passion for building and optimizing physical optical systems.

In my previous industrial experience at INTECOL S.A.S., I successfully integrated vision systems using smart cameras and advanced illumination methods for a car subdivision of Renault, where I was responsible for the hardware-software integration and custom illumination. During my PhD, I pushed this further by building automated wavefront sensing setups from scratch, qualifying high-end optomechanical components from vendors like Thorlabs and Edmund Optics. This hands-on experience in precise system alignment and hardware validation enables me to bridge the gap between complex optical designs and reliable industrial assembly.

With a strong background in QA processes and a proven ability to design rigorous test structures, I would be glad to help optimize Mühlbauer's vision systems. I am fully integrated into the DACH work culture and, as requested, highly willing to support international service assignments. I look forward to contributing my technical expertise to your team.

Sincerely,

Juan David Muñoz-Bolaños
